

Pointer puller kit

This kit is specifically designed to remove and fix the pointers of pressure gauges, in order to be repaired or recalibrated. Every kit includes three chromed-plated brass removers of different groove sizes (3.5, 4 and 4.5 mm.). The shafts have two different sizes (0,75 and 1,25 mm. Ø) and they are interchangeable with the three removers' bodies, allowing to remove virtually any pointer, including those of capsule gauges.

The kit also includes a pointer fixer. It consists of a 180x10 mm. Ø st. steel cylinder with a pressing piston inside, attached to a silicone tube and hand-actuated rubber pear. When the pear is pressed, the internal piston hits on the other end of the cylinder, fixing the pointer.

Delivered in a portable aluminium case. Dimensions: 27x17x8 cms. Weight: 1 Kilogram.
